

ACCESS LOGICAL INK

Speed Patient Care with Tablet-Based Clinical Questionnaires Solution

Your physicians and nurses aim to provide timely and informed care to each patient, and to attend to as many patients as they can each day. Unfortunately, they spend too much time filling in paper questionnaires, and patient data is not available until forms are scanned into the enterprise content/document management system. Many EMR systems are not user-friendly or mobile, and merely increase physician frustration, rather than simplifying the transition to electronic records.

If these challenges are all too familiar, we have a solution for you:
Access Logical Ink (ALI).

ALI – part of the industry-leading Access Enterprise Forms Management (EFM) suite – is a tablet-based documentation solution that enables physicians and nurses to access and complete clinical questionnaires and other documentation from anywhere in the facility. A clinician simply selects the patient, chooses the form type – such as an MRI questionnaire – and completes it using the tablet's stylus.

Upon completion, the data is automatically interfaced into the patient's PACS record and/or EHR via the content/document management system, and is immediately available across the hospital. ALI helps physicians easily transition to hybrid and electronic records by maintaining the speed, flexibility and simplicity of paper while removing its physical limitations.

With this innovative mobile solution, your hospital can:

- Speed care delivery and patient service by accessing and completing clinical questionnaires on the fly

- Improve service to patients who speak another language with multilingual forms

- Automatically index completed questionnaires with patients' EHRs, with no user effort

- Give nurses and physicians more time with patients and less time on paperwork

- Improve data mobility, accuracy, availability and security

- Validate data at the point of collection to minimize errors and ensure all required information is obtained

- Automatically pull in previous data for a patient

- Speed form completion with checkboxes, drop-downs and the ability to complete multiple areas with a single piece of information

- Get even the least tech-savvy users up and running quickly with a familiar pen input interface

- Add annotated diagrams, digital photos and signatures directly to questionnaires

Access Logical Ink in Action for Clinical Questionnaire

Access Logical Ink can make almost any clinical and patient registration process more mobile, efficient and collaborative. In this example, you'll see how it simplifies the completion of an MRI questionnaire.

- 1) A physician searches for a patient by MRN, account, last name or scans the patient's wristband
- 2) She selects the patient and form to be completed - an MRI questionnaire for the patient's knee injury
- 3) If a previous questionnaire has been completed it will prefill with data for editing. Additional data can also be loaded, such as vitals and lab results.
- 4) The clerk reviews the forms and clicks "Submit" with the stylus
- 5) The physician completes the questionnaire, annotates the knee diagrams, signs and submits it
- 6) An image is automatically generated and passed to the patients PACS record, or into the EHR via the content/document management system

Access Enterprise Forms Management

You've just read about the impact of Access's clinical questionnaires solution. Our Enterprise Forms Management suite improves patient care and safety, eliminates paper-related costs and enhances information availability across the hospital, including in:

Patient Access
Emergency Department
Nursing
Physician Services
HIM
Patient Finance
Oncology
Materials Management
Human Resources
Dietary Department
Risk Management
Housekeeping/Environmental Services
