

# ACCESS LOGICAL INK

Speed Patient Registration and Improve Data Mobility

When patients come to your front desk, emergency room or clinic, they want to get treatment as soon as possible. Unfortunately, they're often delayed by the limitations of paper forms.

Typically, a clerk registers a patient in the HIS, and then goes to a storage area to pull each of the forms needed for the patient.

Once the forms are retrieved, the patient fills in and signs each one – often re-writing 90 percent or more of the same information on each form. This is frustrating and delays care delivery. Upon completion, the forms data is unusable until someone scans and manually indexes each piece of paper. If a form is forgotten, lost or illegible the patient must complete it again later.

Traditional EMR systems do nothing to overcome these issues, but we have a solution: Access Logical Ink (ALI).

ALI – part of the industry-leading Access Enterprise Forms Management (EFM) suite – is a tablet-based documentation solution that enables hospitals to access and complete clinical documentation faster than ever before.

Now, a registration clerk registers the patient in the HIS, clicks a button and all required forms are sent to a tablet PC, with demographics pre-filled for the patient's convenience. The patient reviews and signs the forms, the clerk reviews them, and they're interfaced into the EHR directly. ALI helps hospitals easily transition to hybrid and electronic records by maintaining the speed, flexibility and simplicity of paper while removing its physical limitations. And as patients get admitted more quickly with less hassle, they're more satisfied.

With this proven solution, your facility can:

- Speed patient registration to get patients the care they need, faster
- Better serve patients who speak another language with multilingual forms
- Make information available immediately on clinical floors and in patient finance to prompt proactive care and a faster revenue cycle
- Automatically index completed forms with patients' EHRs, with no user effort
- Give registration clerks more time with patients and less time on paperwork
- Improve data mobility, accuracy, availability and security
- Get staff and patients up and running quickly with a familiar interface
- Validate data at the point of collection to minimize errors and ensure all required information is obtained
- Automatically pull in previous data for a patient to avoid redundant effort
- Eliminate redundant effort later in the visit, which used to result from patients re-completing lost forms

## Access Logical Ink in Action for Patient Registration

Access Logical Ink can make almost any clinical and patient registration process more mobile, efficient and collaborative. In this example, you'll see how it simplifies the completion of a bedside consent.

- 1) An admissions clerk registers a patient in the HIS
- 2) She clicks a button to retrieve all his forms, which are prefilled with demographics to speed completion, and sends them to a tablet
- 3) The patient reviews and signs the forms on the tablet
- 4) The clerk reviews the forms and clicks "Submit" with the stylus
- 5) Images of the forms are automatically generated and passed to the patient's EHR for immediate availability via the content/document management system
- 6) Patient info is now available in HIM, patient finance and on clinical floors

## Access Enterprise Forms Management

You've just read about the impact of Access's patient registration solution. Our Enterprise Forms Management suite improves patient care and safety, eliminates paper-related costs and enhances information availability across the hospital, including in:

Patient Access  
Emergency Department  
Nursing  
Physician Services  
HIM  
Patient Finance  
Oncology  
Materials Management  
Human Resources  
Dietary Department  
Risk Management  
Housekeeping/Environmental Services
